

Hypothesis Testing on the TI-83/84

Written by Jeff O'Connell – joconnell@ohlone.edu

Ohlone College

<http://www2.ohlone.edu/people2/joconnell/ti/> - A video tutorial can be found at this site

Stat vs. Data – Throughout this section the calculator will ask you if you have [Data] or [Stats]. *Stats* is when you just have the statistics about the data such as the mean and standard deviation. *Data* is when you have the actual data. In the case where you have Data, you will enter the data into a list and tell the calculator which list the data is in. Both types of examples are shown in this section.

p-values – The Calculator does hypothesis testing by finding the p-value. Recall that the p-value is the area of the tail(s) that the test statistic cuts off. If the p-value is less than the level of significance then we reject the null hypothesis, if the p-value is more than the level of significance then we fail to reject the null hypothesis.

All Confidence intervals and Hypothesis testing can be found by pressing **STAT** and scrolling to [TESTS]

The Population Mean

Example 1: A sample of 38 items is chosen from a normally distributed population with a sample mean of 12.5 and a population standard deviation of 2.8. At the 0.05 level of significance test the null hypothesis that the population mean is 14, that is $H_0: \mu = 14$, $H_1: \mu \neq 14$, with $\alpha = 0.05$.

Solution: We choose [1:Z-TEST...] since we are using a z-distribution. Enter the information as shown in screen 1 below, highlight [Calculate] and press **ENTER** to get screen 2 or [Draw] to get screen 3.

```
Z-Test
Inpt:Data Stats
μ₀:14
σ:2.8
x̄:12.8
n:38
μ:≠μ₀ <μ₀ >μ₀
Calculate Draw
```

Screen 1

```
Z-Test
μ≠14
z=-2.641891716
P=.0082445225
x̄=12.8
n=38
```

Screen 2

Screen 3

The p-value is $0.0082 < \alpha$ so we Reject H_0 .

Example 2: A sample of 7 items is chosen from a normal distribution with the following results: {1, 5, 6, 8, 12, 16, 18}. Test the claim that $\mu < 10$, that is $H_0: \mu = 10$, $H_1: \mu < 10$, with $\alpha = 0.01$.

Solution: Here we are given the actual data from the sample. We can have the calculator do all of the work on the sample by entering the data into a list, say L1. We choose [2:T-TEST...]. Enter the information as shown in screen 4 below, highlight [Calculate] and press **ENTER** to get screen 5 or [Draw] to get screen 6.

```
T-Test
Inpt:DATA Stats
μ₀:10
List:L1
Freq:1
μ:≠μ₀ <μ₀ >μ₀
Calculate Draw
```

Screen 4

```
T-Test
μ<10
t=-.2454095494
P=.4071589426
x̄=9.428571429
Sx=6.160550377
n=7
```

Screen 5

Screen 6

The p-value is $0.4072 > \alpha$ so we Fail to Reject H_0 .

NOTE: Freq stands for Frequency which may be used if you have data where a lot of the data points are repeated. For example, if your data consists of 1, 1, 1, 2, 2, 3, 4 you can enter all of the distinct the data points in L1 and the frequencies in L2. So $L1 = \{1, 2, 3, 4\}$ and $L2 = \{3, 2, 1, 1\}$. We can enter L1 as the *List* and L2 as the *Freq*. It will most often be the case that we will use 1 as the Freq but this option is available.

The population proportion

Example 3: For $x = 14$, $n = 35$ test the claim that $p > 0.3$, that is $H_0: p = 0.3$, $H_1: p > 0.3$, with $\alpha = 0.05$.

Solution: We choose [5:1-PropZTest...]. Enter the information as shown in screen 7 below, highlight [Calculate] and press **ENTER** to get screen 8 or [Draw] to get screen 9.

```
1-PropZTest
P0: .3
x: 14
n: 35
PROP≠P0 <P0 >P0
Calculate Draw
```

Screen 7

```
1-PropZTest
PROP>.3
z=1.290994449
P=.0983528664
p̂=.4
n=35
```

Screen 8

Screen 9

The p-value is $0.0984 > \alpha$ so we Fail to Reject H_0 .

NOTE: x and n must be an integers.

Comparing two population proportions

Example 4: For $x_1 = 14$, $n_1 = 40$, $x_2 = 17$, and $n_2 = 50$ test the claim that $p_1 > p_2$, that is $H_0: p_1 = p_2$, $H_1: p_1 > p_2$, with $\alpha = 0.1$.

Solution: We choose [6:2-PropZTest...]. Enter the information as shown in screen 10 below, highlight [Calculate] and press **ENTER** to get screen 11 or [Draw] to get screen 12.

```
2-PropZTest
x1: 14
n1: 40
x2: 17
n2: 50
P1≠P2 <P2 >P2
Calculate Draw
```

Screen 10

```
2-PropZTest
P1>P2
z=.0992040494
P=.4604880705
p̂1=.35
p̂2=.34
p̂=.3444444444
n1=40
n2=50
```

Screen 11

Screen 12

The p-value is $0.4605 > \alpha$ so we Fail to Reject H_0 .

Hypothesis testing for two population means.

Example 5: The following samples were taken from normal distributions. Test the claim that $\mu_1 \neq \mu_2$, that is $H_0: \mu_1 = \mu_2$,

$H_1: \mu_1 \neq \mu_2$, with $\alpha = 0.05$.

$$\bar{x}_1 = 78.5 \quad \bar{x}_2 = 75.3$$

$$\sigma_1 = 12.8 \quad \sigma_2 = 11.4$$

$$n_1 = 40 \quad n_2 = 50$$

Solution: Select [3:2-SampZtest...]. and enter the information shown in screen 13, highlight [Calculate] press **ENTER** to get the results shown in screen 14 or [Draw] to get the results in screen 15.

```
2-SampZTest
Inpt: Data Stats
σ1: 12.8
σ2: 11.4
x1: 78.5
n1: 40
x2: 75.3
n2: 50
μ1≠μ2 <μ2 >μ2
Calculate Draw
```

Screen 13

```
2-SampZTest
μ1≠μ2
z=1.236710935
P=.2161945469
x1=78.5
x2=75.3
n1=40
n2=50
```

Screen 14

Screen 15

The p-value is $0.2162 > \alpha$ so we Fail to Reject H_0 .

Example 6: For the sample information taken from normal distributions shown in the screen to the right with L1 being sample from population 1 and L2 from population 2 test the claim that $\mu_1 > \mu_2$, that is $H_0: \mu_1 = \mu_2$, $H_1: \mu_1 > \mu_2$, with $\alpha = 0.05$.

L1	L2	L3	Σ
1	2	-----	
1	4		
1	6		
1	8		
-----	-----		
L2(1)=2			

Solution: After entering the sample data into L1 and L2 as shown, we must determine if the variances are significantly different, that is, test the claim $H_0: \sigma_1^2 = \sigma_2^2$ against $H_1: \sigma_1^2 \neq \sigma_2^2$. Select [D:2-SampFTest...] and enter the information shown in screen 16, highlight [Calculate] press **ENTER** to get the results shown in screen 17 or [Draw] to get the results in screen 18.

```

2-SampFTest
Inpt: DATA Stats
List1:L1
List2:L2
Freq1:1
Freq2:1
 $\sigma_1$ : 50% < $\sigma_2$  > $\sigma_2$ 
Calculate Draw
    
```

Screen 16

```

2-SampFTest
 $\sigma_1 \neq \sigma_2$ 
F=1.5
P=.7698003589
Sx1=3.16227766
Sx2=2.5819889
 $\downarrow$ X1=5
    
```

Screen 17

Screen 18

The large p-value (bigger than $\alpha = 0.05$) indicated that we must “pool” the variances. If the p-value were smaller than α we would not pool the variances. Select [4:2-SampTTest...] and enter the information shown in screen 19, highlight [Calculate] press **ENTER** to get the results shown in screen 20 or [Draw] to get the results in screen 21.

```

2-SampTTest
Inpt: DATA Stats
List1:L1
List2:L2
Freq1:1
Freq2:1
 $\mu_1 \neq \mu_2$  < $\mu_2$  > $\mu_2$ 
 $\downarrow$ Pooled: No Yes
    
```

Screen 19

```

2-SampTTest
 $\mu_1 > \mu_2$ 
t=0
P=.5
df=7
 $\downarrow$ X1=5
 $\downarrow$ X2=5
 $\uparrow$ Sx1=3.16227766
Sx2=2.5819889
Sxp=2.92770022
n1=5
n2=4
    
```

Screen 20

Screen 21

The p-value is $0.5 > \alpha$ so we Fail to Reject H_0 .

ANOVA

Example 7: Consider the samples taken from three normally distributed populations shown in screen 22. Test the claim that the populations all have the same mean, that is $H_0: \mu_1 = \mu_2 = \mu_3$, H_1 : *Not all populations have the same mean*, with $\alpha = 0.05$.

Solution: After entering the data as shown, select [F:ANOVA()], enter the information shown in screen 23, press **ENTER** to get the results shown in screen 24.

L1	L2	L3	3
25	34	18	
28	29	19	
29	27	24	
24	26	26	
18	24	27	
17		28	
-----		29	
L3(n)=18			

Screen 22

```

ANOVA(L1,L2,L3)
    
```

Screen 23

```

One-way ANOVA
F=1.528278459
P=.2488412544
Factor
df=2
SS=60.5634921
 $\downarrow$ MS=30.281746
Error
df=15
SS=297.214286
MS=19.8142857
Sxp=4.45132404
    
```

Screen 24

The p-value is $0.2488 > \alpha$ so we Fail to Reject H_0 .

NOTE: To do the ANOVA test on the TI-83/84 you must have the data, not the statistics for the data.
